EXPERIENCE

Code Climate – Product Engineer

March 2025 – Present

- Architected Metrics Explorer V2 from the ground up, delivering a query builder, multi-metric charting with dual Y-axes, group-by analysis, and prior period comparisons — now a core product feature
- Built the Activity and Foundations pages, introducing engineering visualizations with interactive charts, date carousels, and paginated employee views with SVG graphics
- Developed Resource Explorer V2's filtering system with fuzzy search, date range pickers, role-based access control, and URL-persisted state management
- Led migration of admin portal features from legacy app to modern Remix architecture, including OAuth integrations, webhook APIs, and source configuration management
- Implemented WCAG accessibility standards across app features, including screen reader support and keyboard navigation
- Delivered 460+ pull requests as a high-velocity contributor across the full stack — TypeScript React/Remix frontend, Node.js APIs, ClickHouse analytics queries, DBT transformations, and Playwright E2E test coverage

CyberConvoy – Full-Stack Developer

February 2024 – February 2025

- Primary contributor to the platform, owning features end-to-end across frontend, backend, and infrastructure
- Developed an AI-powered query assistant (Mistral/Claude/GPT) with real-time streaming, regex-based SQL parsing, and a dynamic split-view UI, enabling non-technical users to self-serve data insights
- Built a Snowflake alternative using Trino with async generators and HTTP streaming, enabling analysts to query millions of rows with sub-second initial response times while cutting licensing costs
- Integrated 5 external threat intelligence APIs into a unified reconnaissance platform with Leaflet-based geolocation mapping for anomaly detection
- Implemented real-time alerting with Socket.IO and Auth0 RBAC with multi-tier permissions for analysts, engineers, and clients
- Optimized Redux data loading architecture, improving frontend responsiveness by 50%
- Led full-stack TypeScript migration and established ESLint standards across the codebase

NeuraFlash - Software Developer

January – August 2022 (8-month project)

- Rebuilt an internal tool using React to help 20+ Salesforce Einstein Bot developers create JSON payloads to enhance their bots' UI
- Reduced codebase size by over 1000 lines by inventing a recursive component to dynamically generate forms for different payloads
- Decreased potential future development time by over 50% by devising a simple object-based generation syntax

IBM - Front-End Developer

May – August 2021 (3-month project)

- Produced 3 UI components with React and JavaScript to develop major application features
- Patched 5+ bugs from existing components to increase application integrity
- Utilized Python and Swagger to test 15+ JSON payloads and improve backend Flask API error handling by at least 5%

PROJECTS

Nummle (Personal startup product - MERN, Next.js + Supabase)

September 2022 – Present

- Began producing my own web application product and business for my Senior Capstone project
- Continued developing my product as a client project for subsequent senior year classes, managing ongoing technical and entrepreneurial tasks for them while I contribute in parallel

EDUCATION

Stevens Institute of Technology, BS, Computer Science | Minor, Cybersecurity

CERTIFICATIONS

- AWS Developer Associate (DVA-C02), Amazon

November 2023 – November 2026
